Adobe is also a provider of a range of digital imaging products which employ Photoshop and other technologies. Use of Photoshop by industry There are a number of ways that the term "photoshopping" is used. Photography industry In the photographic industry, photographers frequently use Photoshop for fine-tuning and/or manipulating photographs to produce the desired look. This might include, but is not limited to, cropping the image, removing unwanted portions, post-processing a digital negative, cleaning up a digital negative, etc. It is often very common practice to take a number of images under various conditions (the aperture, shutter speed, etc.) and then process a single image with Photoshop to produce the final look. Media industry In the media industry, broadcast and print professionals often use Photoshop to edit photographs and/or videos. This might include, but is not limited to, adjusting focus, color temperature, saturation, contrast, exposure, lighting, color balance, (white) balance, correcting lens distortion, straightening photographs, cropping, rotoscoping, and removing unwanted portions of photographs. Political industry In the political industry, Photoshop is often used to manipulate photographs and/or videos of politicians, often resulting in a "photoshopped" image. Many political advertisements and campaign videos can be found with Photoshop or similar manipulations. Internet industry In the internet industry, Photoshop is often used in the creation and editing of GIFs, videos, and websites. Education industry In the education industry, Photoshop is used by teachers to grade and/or rate student's work. Photographers' use of Photoshop Photographers often use Photoshop for a large number of reasons, including adding special effects to photographs (known as in-camera effects, post-processing effects, or image manipulation effects), adjusting the color balance, removing unwanted portions, retouching (removing blemishes, red eye, etc.), cropping, straightening, rotoscoping, and adding special effects. Film industry The film industry often uses Photoshop to resample and/or rescale images. Photoshop can also be used to alter images for television, but may require other software applications to create television-compatible images. Animation industry In the animation industry, Photoshop is often used to create digital illustrations that are then animated. Photoshop is also often used to render (computer-generated) 3D objects or

Brush Types Brush Types are one of the most commonly used features in photoshop. These are the individual types of brushes that can be created in your brush library. You can make your own custom brushes using different brush types from the brush tool. Brush Basics: Brush Basics are the main options that you will have when you open up the Brush tool. Diameter The diameter of the brush determines what kind of shape the brush will create. The numbers you will have on your brush tool will be the value of the diameter range you chose. The larger the value, the smaller the brush and the more paint it will take to create the brush. Hardness To increase or decrease the hardness of the brush, decrease or increase the opacity number in the Brush Basics. Softness Softness and Hardness affect the size of the brush. It will be a simple or semi-soft or semi-hard. Softness determines how soft or hard the brush will make paint strokes. Soft brushes are able to create smooth curves with limited pressure. Hard brushes create paint strokes with extreme pressure and are usually considered to be fast. Hard brushes create large streaks of paint. Soft brushes create finer strokes. Angle Similar to the diameter, the angle of the brush determines how it bends, and more exactly, how much it will curve at the end. The range is from 0-180 degrees and at 0 degrees, the brush is straight. You can use this to draw straight lines or create smooth transitions along straight lines. Opacity (Hold Shift to duplicate) Opacity is the amount of paint the brush will take to create a stroke. The default value of opacity is 100. The higher the value, the less paint the brush will take. Scumble Over Scumble and Burn Over are brush types that consist of a drop shadow applied to an image or an object. The lightening of the drop shadow is on the bottom of the brush. The shadow below the brush is drawn using Scumble and the shadow on top is drawn using Burn Over. Dodge A Dodge brush gives the appearance of dodging out parts of an image that is too light. This allows you to lighten up some of the areas in your image. Dodge and Burn Dodge and Burn brushes is often used for an image that has a large number of lights and darks. You can use the Dodge and Burn brushes to lighten up your darkest areas and darken your lightest areas.

I remember reading that 7.1 audio was the equivalent to surround sound in a TV. What is the name of this display option? I was looking for a way to specify 7.1 surround sound in a tv, I couldn't find anything about it. A: The "7.1" format is really a special case of surround sound with only 5 speakers. The term "7.1" is derived from the standard of using 7.1 channels to represent a surround-sound configuration. However, there are a variety of methods by which the 7.1 channel layout can be realized. Typical are a 7.1 "stereo" surround option (more towards the front than the rear, as in a "2.0" surround configuration), a 7.1 "surround-back" option (more towards the rear than the front, as in a "3.0" surround configuration), and a 7.1 "surround" option (standard 5.1 channel layout). Generally speaking, the "7.1" channels of a "surround" option are only partially utilized for surround sound, as the lossy compression of digital sound makes them less effective than the true 5.1 "LFE" channel of a surround option, which would have the bass frequencies going to both the front and rear speakers. This is more common with digital sound than with analog sources, because of the lower audio quality of the analog formats. Now, the term "surround" is more properly used to describe a typical 5.1 channel surround configuration. A "5.1" surround option will properly utilize the 5 channels for surround, and thus typically benefit more from the lossy compression of digital sound than the "surround-back" option. So, I think you can probably rule out going through the menus to make the TV a "7.1
