Converts bitmap to vector Convert tif, bmp, jpg, png to vector Converts vector to raster, tif, jpg, png, bmp Update 2020: It's free, but only compatible for MS Windows. A: ImageMagick: There is an option in Inkscape to convert image to vector(or any vector format). I have never used it though. GhostScript: There is a GhostScript command, convert from ImageMagick. Wiki link, paragraph 4: There is a command-line Ghostscript utility that can be used to turn a scanned image into a vector outline, but this process is quite labour-intensive and therefore normally done in a vector graphics package that can handle raster and vector images natively. Alternatively, a commercial Ghostscript package such as those listed in "Note 4" can be used to convert images to vector. Delivering drugs and

optical stimuli with the same light source requires a sophisticated method to control the timing of stimulation. Different drug applications are being explored for the treatment of diseases, including for the treatment of vascular disorders. An important area of investigation is the delivery of optical and chemical signals into cells for the treatment of disorders such as neuronal degeneration or muscle injury. Within these fields, the delivery of optical or chemical treatments based on light-emitting diodes (LED) has significant advantages over the delivery of optical treatments by lasers. In particular, LED-based therapy offers the potential for continuous treatment over long periods of time as opposed to the need for readjustment during the laser-based treatment. Within the field of cell biology, the delivery of pharmaceuticals is often achieved by utilizing fluorescent molecules that are designed to be internalized and specific to a target within the cell. A major complication associated with the use of fluorescent molecules is the fact that the molecules may also be taken up by other cells within the tissue. By comparison, the delivery of optical stimuli using

LEDs is less likely to stimulate cells other than the intended target cell. In a particular example of optical stimulation, light-emitting diodes are used to deliver optical or chemical stimuli to a muscle cell. One method of delivering optical stimuli to a muscle cell includes the use of red and infrared LEDs that are fixed in a rigid structure that can be placed in direct contact with the muscle cell. While this method permits the optical stimulation
