## Photoshop 2022

The growth in the field of computing over the last few decades has been nothing short of miraculous. Improvements in computing efficiency, such as the greater processing power provided by faster computer microprocessors, have resulted in enormous increases in both the speed and capabilities of computing systems. The increased capacity of the hard drive storage devices that have been integrated into these computing systems has also contributed to the increase in speed and performance. These enhancements have allowed computers to achieve traditionally unheard of tasks within seconds instead of minutes, and are now capable of receiving and displaying data at speeds that rival the human eye. In addition to the aforementioned advancements in the hardware, software programs continue to evolve at a rate that is accelerating dramatically. This increased sophistication results from the ongoing use of new programming languages, design strategies, as well as the ever-more intricate nature of many applications in use today. While the increased processing speed may be driving advancements in software design, an equally important design consideration is the degree to which a software program may be updated, and how this update may be accomplished seamlessly. Updating software programs can be a very complex and time consuming task. It involves not only the identification of the defective and defective area of the software, but also the re-assembly of the corrected and corrected code portions. This, of course, often requires the creation of an entirely new software program before the old version may be replaced with the new. When re-keying the software can be a time consuming process that may occupy many hours or even days. More importantly, modern software applications are often designed for extended use. As a result, these applications are often installed on portable or other shared computer platforms. Thus, it is essential that the software programs have the capability of being easily upgraded. By doing this, the owner of the application may purchase a newer, improved model having a better chipset, and still be able to add the improvement without recoding of the original software program. Therefore, there exists a need in the art for a system that will accomplish the seamless upgrading of software programs. In the patent application discussed above, the disclosure of which is incorporated herein by reference, an up- and-coming Internet start-up company agreed to establish a demonstration project for Windows.RTM. operating system-based disk operating system software on its PC-compatible computer systems. The demonstration project was established and marketed as Novell.RTM. 95. The disk operating system (DOS) program that was being developed for the demonstration project is known as EXCHGNOS.EX
