Mini International Neuropsychiatric Interview 7.0 Pdf 20

1/7

Clinical structured interviews were developed for diagnostic precision, speed and accuracy and carry several advantages. Because the questions are precise and elicit only a limited number of responses, these assessments can largely be administered by non-specialized interviewers, leading to high inter-rater reliability. Special algorithms are built to distinguish between clinically significant symptoms from regular stressorsa feature that can be used to ensure homogenous groups in clinical trials. Among the most commonly used clinical structured interviews internationally, are the Mini International Neuropsychiatric Interview (MINI) [12], Structured Clinical Interview (SCID), Present State Examination (PSE) and the Composite International Diagnostic Interview (CIDI) [13, 14]. From these interviews, only the DIS [15], the PSE-10 [16] and the CIDI [17], exist in Modern Standard Arabic, in addition to a Moroccan dialect validated version of the M.I.N.I. [18]. Clinical

structured interviews were developed for diagnostic precision, speed and accuracy and carry several advantages. Among the most commonly used clinical structured interviews internationally, are the Mini International Neuropsychiatric Interview (MINI) [12], Structured Clinical Interview (SCID), Present State Examination (PSE) and the Composite International Diagnostic Interview (CIDI) [13, 14].

Mini International Neuropsychiatric Interview 7.0 Pdf 20

The current study was designed to validate a newly developed Arabic version of the Mini International Neuropsychiatric Interview (M.I.N.I.-AR). The comparability of the overall performance of the M.I.N.I.-AR with that of the original German version of the M.I.N.I. version 7.0 was the first aim of this study. According to this, the second aim of this study was to investigate the pre - post-intervention changes of the mental health of Arabic-speaking refugees who were regularly seen in the mental health care facilities of a university. In this regard, the third aim of this study was to compare the mental health of Arabic-speaking refugees with that of native Arabic speakers. The Mini International Neuropsychiatric Interview (M.I.N.I.) was developed by Sheehan et al. [14] to explore some psychiatric

4/7

disorders according to the DSM-III-R, DSM-IV and DSM-5 diagnostic criteria. The reliability and validity studies were conducted comparing the MINI to the SCID-P for DSM-III-R and the CIDI (a structured interview developed by the World Health Organization). The results of these studies show that the MINI has similar reliability and validity properties to both these instruments, but can be administered in a much shorter period of time (mean 18.7 11.6 minutes, median 15 minutes) than the above referenced instruments. Clinicians can use it after a brief training session. Lay interviewers require more extensive training. The MINI has been translated into over 70 languages. This interview was developed for non-clinical and illiterate adolescents. Participants were willing to fill in the forms after a short briefing. The program was developed using a conceptual model of developmental psychopathology. The first version of the interview was pilot tested with adults who met the criteria for a current depressive

episode and who were participating in the IMAGE study. Researchers have developed a web-based version of the instrument (Linehan et al., 2003). The Linehan group also has developed the Linehan Emotional Awareness Scale, which was used with IMAGE data. The work on the IMAGE study is ongoing. A CFA was performed. Although the fit indices were satisfactory, we did not accept the CFA as a final version because the maximum likelihood method produced skewed data and the sample size was not large enough to warrant this. Consequently, we reduced the number of dimensions and items but checked the psychometric properties of the new model 5ec8ef588b
